FLAG 1:

View the admin panel for the flag.

FLAG 2:

The search box on the notes page does more than it appears. Try some unusual input and see what the database gives back.

FLAG 3:

Pay close attention to the URL when you visit your notes. Is the server really only showing you your own data?

FLAG 4:

The artists page loads a file based on something in the URL. What else might be on this server worth reading? The flag is in the `/secret/flag4.txt` directory

FLAG 5:

The server keeps a record of everything. What if that record contained something it shouldn't? What if you could make the server read it back? The flag is in the `/secret2/flag5.txt` directory.

FLAG 6:

The upload page has rules about what files it accepts. Are those rules as solid as they look? Once you get something running, the flag won't be handed to you — you'll need to go looking for it. It is in `in/home/griz/flag6.txt`

FLAG 7:

Not everything on this site is linked in the navigation. Some pages don't like being visited the normal way. The key to getting in is somewhere on the site already.

FLAG 8:

Check every corner of the site.

FLAG 9:

The web app alone won't get you here. Get a foothold on the server first, then think about who you are and who you could become. The flag is flag9.txt in the root directory.

Credentials: rezz: hypnotize!

FLAG 10:

The bot that visits this site is carrying something valuable. Find a way to make it hand it over.

FLAG 11:

The bot is logged in as user griz and visits the forum. Your settings page has no protection against unwanted changes. Can you make the bot do something it didn't intend to?

FLAG 12:

The visuals page will load anything you point it at. What happens if you point it at something that tells the server to do more than just display content? The flag is in /secret/flag12.txt

FLAG 13:

There are hidden pages on this site. One of them gives out tokens, and another accepts them. Look closely at how the token is verified — is it really as secure as it seems?

FLAG 14:

The visuals page makes requests on behalf of the server. Where else might that server be able to reach that you can't? There is a hidden server on port 7777.

FLAG 15:

Getting a flag printed on a page is one thing. Getting a shell is another. Once you're in, look around. The flag is in the root directory at flag15.txt.
